The present invention provides for a method for treating a condition associated with from a subject suffering extracellular zinc sphingomyelinase activity which comprises administering to the subject an amount of a zinc sphingomyelinase to decrease extracellular effective sphingomyelinase activity in the subject and thereby treat the The present invention also provides for a method for determining whether a compound inhibits an activity of an extracellular zinc sphingomyelinase involving ceramide formation (a) contacting a sample containing zinc which comprises: sphingomyelinase under acidic pH conditions known to associated with the activity of such zinc sphingomyelinase, with: (i) a substrate of the zinc sphingomyelinase enzyme, and (ii) the compound being evaluated; (b) measuring the ceramide in the the amount (c) determining from (a); activity in the sample based sphingomyelinase concentration of ceramide measured in step (b); and (d) comparing the amount of sphingomyelinase activity determined in step (c) with the amount of sphingomyelinase activity determined in the absence of the compound, so as to determine whether the compound inhibits the activity of zinc sphingomyelinase.
